

# RealTime (RT) Kernel

basierend auf : [https://www.raspberrypi.com/documentation/computers/linux\\_kernel.html#building](https://www.raspberrypi.com/documentation/computers/linux_kernel.html#building)

## Compilieren

- `sudo apt install git bc bison flex libssl-dev make libncurses5-dev #I think this is all the tools required`
- `mkdir kernel && cd kernel/`
- `git clone --depth=1 --branch rpi-6.12.y`  
<https://github.com/raspberrypi/linux>
- `wget`  
<https://mirrors.edge.kernel.org/pub/linux/kernel/projects/rt/6.12/patch-6.12.39-rt11.patch.gz>  
<https://mirrors.edge.kernel.org/pub/linux/kernel/projects/rt/6.12/>
- `cd linux/`
- `zcat ../patch-6.12.39-rt11.patch.gz | patch -p1 --dry-run #check the patch fits`
- `zcat ../patch-6.12.39-rt11.patch.gz | patch -p1`
- `KERNEL=kernel8`
- `make ARCH=arm64 bcm2711_defconfig`
- `make ARCH=arm64 menuconfig`
  - General setup --->
  - Preemption Model (Preemptible Kernel (Low-Latency Desktop)) --->
    - [\*] Fully Preemptible Kernel (Real-Time)
    - [ ] Preemption behaviour defined on boot
  - CPU Power Management aus !
  - Beim Exit Config Save → Yes
- `nano .config`  
`CONFIG_LOCALVERSION="-V8_DrKlipper_RT"`
  -  Hier auf gar keinen Fall Leerzeichen einbauen. Gibt sonst am Ende Compile und Kopierfehler!
- `time make -j6 ARCH=arm64 Image.gz modules dtbs`
  - CPU Cores \* 1,5 → `nproc`

```
echo $KERNEL sudo make modules_install sudo cp arch/arm64/boot/dts/broadcom/*.dtb /boot/ sudo cp arch/arm64/boot/dts/overlays/*.dtb* /boot/overlays/ sudo cp arch/arm64/boot/dts/overlays/README /boot/overlays/ sudo cp arch/arm64/boot/Image.gz /boot/$KERNEL.img
```
